TOP SECRET

Fig.2

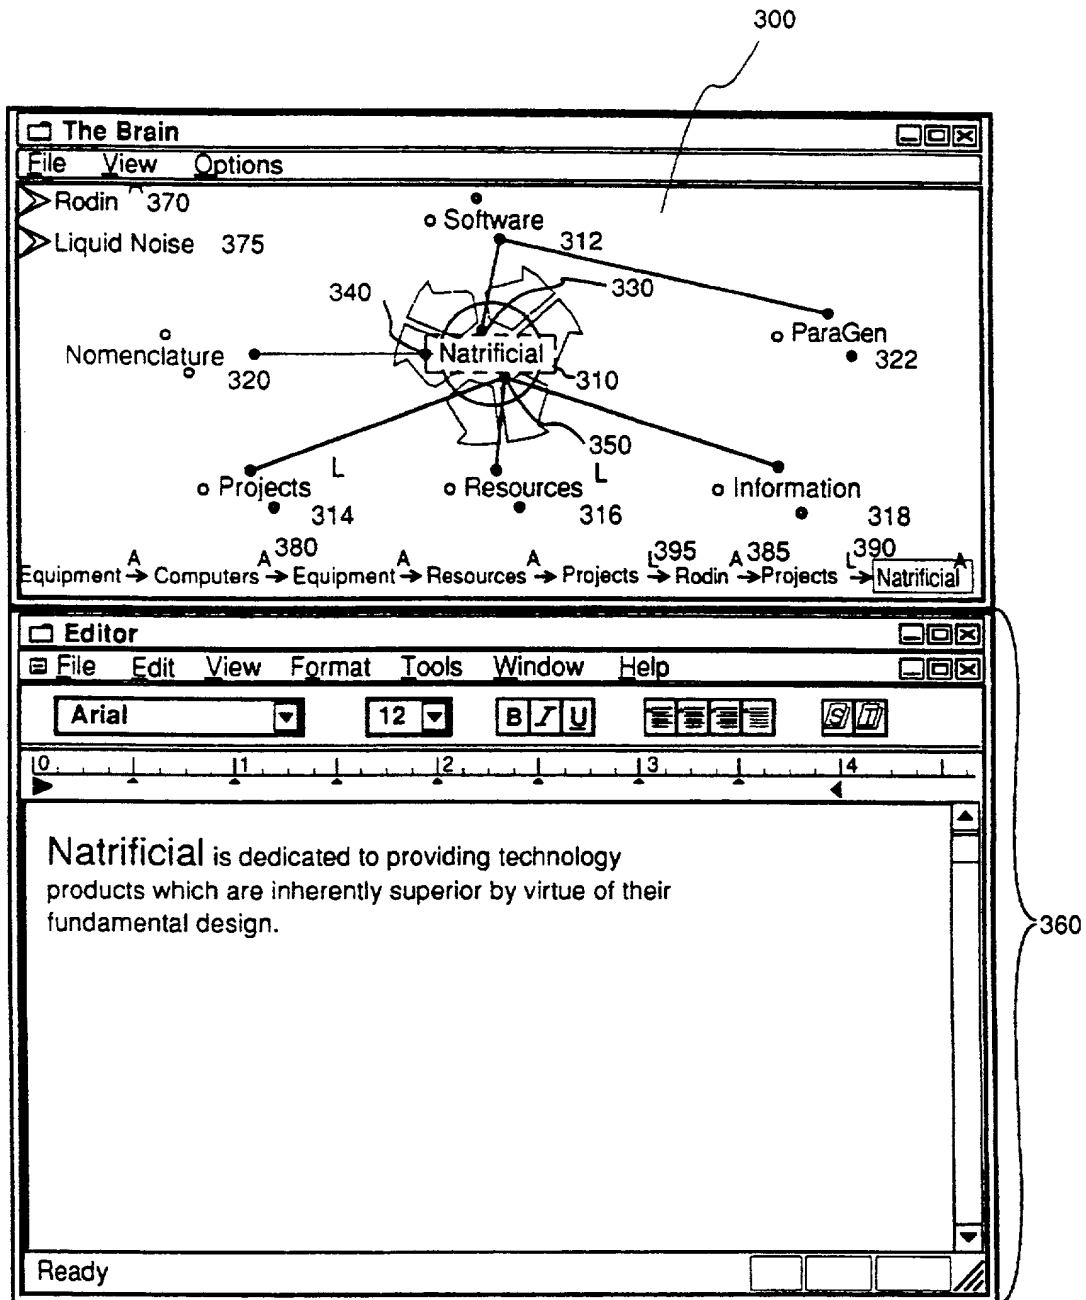

Fig. 3

The screenshot displays a Macintosh-style graphical user interface with two overlapping windows.

The top window, titled "The Brain", has a menu bar with "File", "View", and "Options". It contains a hierarchical diagram. At the top is a node labeled "Companies". Below it is a node labeled "Software", which is enclosed in a circular icon with a gear-like border. To the right of "Software" are two nodes: "Fashion" and "Design". Below "Software" are two nodes: "ParaGen" (with a sub-label "322") and "Natrificial" (with a sub-label "310"). A path is highlighted at the bottom of the window: "Computers" → "Equipment" → "Resources" → "Projects" → "Rodin" → "Projects" → "Natrificial" → "Software". The arrows between "Rodin" and "Projects", and between "Natrificial" and "Software", are labeled with an "A". The arrow between "Natrificial" and "Software" is also labeled with an "L".

The bottom window, titled "Editor", has a menu bar with "File", "Edit", "View", "Format", "Tools", "Window", and "Help". It features a text area with a ruler at the top. The ruler shows a scale from 10 to 14. The text area is currently empty. The status bar at the bottom of the window displays "Ready".

# Algorithm for drawing the plex with distant thoughts

1. Create a list of thoughts to be drawn and their screen locations:
  2. Add the central thought to the list.
  3. Add children to the list.
  4. Add parents to the list.
  5. Add jumps to the list.
  6. Add siblings to the list, checking first that they are not already on the list.
  7. Add distants of children to the list, checking first that they are not already on the list.
  8. Add distants of parents to the list, checking first that they are not already on the list.
  9. Add distants of jumps to the list, checking first that they are not already on the list.
  10. Add distants of siblings to the list, checking first that they are not already on the list.
11. Draw the lines that connect each thought:
  12. For each item in the list:
    13. Get each item in the list:
      14. If the two items are related, draw lines between them from and to the appropriate gates.
15. Draw the distant thoughts:
  16. For each item in the list:
    17. If it is a distant thought, draw it.
18. Draw the other thoughts:
  19. For each item in the list:
    20. If it is not a distant thought, draw it.

Fig. 23

```

// the non recursive method for searching thoughts
// tries to find a route from nSrc to nDest other than a direct relation
// returns TRUE if found
boolean Search(int nSrc, int nDest)
{
    //create the lists
    ThoughtList posList;    //list of thoughts that possibly connect
    ThoughtList notList;    //list of thoughts that do not connect
    //empty the lists
    posList.Initialize();
    notList.Initialize();

    //add the source to the not list since we cannot go directly
    //to the destination,
    notList.Add(nSrc);

    //since we cannot go directly to the destination,
    //add all relates except the destination to the possible list
    Thought src(nSrc);
    for(int n = 0;;n++)
    {
        int nRel = src.GetRelate(n);
        if(!nRel)
        {
            //no more relations, done
            break;
        }
        if(nRel != nDest)
        {
            //add it to the possibly connect list
            posList.Add(nRel);
        }
    }

    while(TRUE)
    {
        //check the first possibility
        int nTest = posList.GetFirst();
        if(!nTest)

**Linking a Thought (assumes both are onscreen)**

	Client 5430	Directory Server 5431	Brain A Server 5432	Brain B Server 5433
5460	Link 1A and 1B (jump) One thought may be active in the plex the other already as a pin or in the past thought list (both are multi-brain enabled)			
5461	Check local dir cache for location of A			
5462	Found			
5463	Send message to A describing link from 1 to 1B (relationship, thought id, brain id "jump, unique brain id of B")			
5464			Store link from 1 to 1B	
5465	Check dir cache for B			
5466	Found			
5467	Send message to B describing link from 1 to 1A ("jump, unique brain id of A")			
5468				Store link from 1 to 1B
5469	Display link			

Figure 74

Creating a Thought

	Client 5430	Directory Server 5431	Brain A Server 5432	Brain B Server 5433
5470	Create new thought from 1A (jump)			
5471	Check local dir cache for location of A			
5472	Found			
5473	Send message to A describing new thought from 1 (relationship, name/content "jump, alan")			
5474			Create new thought and store content	
5475			Store link between id 1 and new id	
5476			Return new thought and link info	
5477	Display

Figure 75

**Finding Other Brains**

	Client	Directory Server	Brain C Server
5480	Request list of Brains or search for a Brain		
5481		Look for Brains that match request	
5482		Return results (Brain name, id, location)	
5483	Add locations to cache		
5484	Display results in a window.		
5485	User selects a Brain (Brain C)		
5486	Look up Brain in cache		
5487	Ask for starting thought		
5488			Query DB for info and links.
5489			Return
5490	Display		

**Finding Thoughts in Other Brains**

	Client	Directory Server	Brain A Server	Brain B Server	Brain C Server
5491	Search for a Thought (may specify a list of Brains to search in via a list obtained from the directory server, or search a default set)				
5492	Ask directory server to perform search				
5493		Query each Brain server			
5494			Check for matching thoughts	Check for matching thoughts	Check for matching thoughts
5495			Return list	Return list	Return list
5496		Compile results into a single list with all info (Brain id & location, thought info & id)			
5497	Add locations to cache				
5498	Display results in a window.				
5499	User selects a Thought				
5500	Activate thought
